## DETAILED ACTION

### ***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Rosenfeld (US 6307576 B1).

As per claim 1, Rosenfeld teaches a method for translating an animation vector to a target mix vector, comprising steps for: generating a calibration vector; and

Art Unit: 2671

mapping the animation vector to the target mix vector using the calibration vector (Rosenfeld, figure 3; and column 6, line 25 to column 7, line 35). It is noted that Rosenfeld does not explicitly disclose an animation vector, a target mix vector, a calibration vector as claimed; however, Rosenfeld's the morph weight sets transitions from it's current state to its target state (column 6, lines 54-59) analogous to Applicant's animation vector, target mix vector, and calibration vector because a vector is a one-dimensional array (Dictionary), the animation vector is a one-dimensional array of animating points, the target vector is a one-dimensional array of target points, the transitional vector is a one-dimensional array of the transitional operations applied to move the animation points to the target points. It would have been obvious to a person of ordinary skill in the art at the time the invention was made using the morph weight sets with the weights as the components of the vectors for the transitions, current, target state to produce facial expression in the production of animated product because in Rosenfeld teaching, the animation vector (i.e., the current state) is mapped by the calibration vector (i.e., the transitionary curve, the transition curve is the graphical representation of the transitional operation) into the target mix vector (i.e., the target state) for forming the animation process.
